Class Index

1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

options	Receives, modifies by user input and stores CLI arguments	3
pixel	A class to house the SG estimation for a single pixel	4
SGb	The Stauffer-Grimson class	8

Chapter 2

Class Documentation

2.1 options Class Reference

The options class receives, modifies by user input and stores CLI arguments.

Public Member Functions

- void `info` ()
print current settings to stdout
- void `resize` (cv::Mat &frame)
resize the input frame
- void `peek` (cv::Mat &frame)
set the imageSize options by peeking at the frame
- bool `goodDim` (int v)
checks whether input dimension is valid
- bool `goodIter` (int v)
checks whether input iteration is valid
- bool `argparse` (int argc, char **argv)
parse command line arguments

Static Public Member Functions

- static void `usage` ()
print accepted usage
- static void `usage_controls` ()
usage_controls Display control interface of main.

Public Attributes

- vector< string > [methodOpts](#)
Container to pass on options to the method that will run.
- pair< int, int > [imageSize](#)
Specified image size, std::pair.
- bool [resizeImage](#)
Should resize image or not.
- bool [useVideo](#)
Should get input from a video file.
- bool [doUpdate](#)
Should print updated parameters.
- int [strelOpenDim](#)
Opening by reconstruction strel dimension.
- int [strelCloseDim](#)
Closing by reconstruction strel dimension.
- int [numErode](#)
How many times to erode in opening by reconstruction.
- int [numDilate](#)
How many times to dilate in closing by reconstruction.
- string [method](#)
Method to use.
- string [videoFile](#)
Video path.

Static Public Attributes

- static const int **MAXITER** = 25

2.1.1 Detailed Description

The options class receives, modifies by user input and stores CLI arguments.

method: the background estimation method to use imageSize: the size in pixels to resize the image numErode: how many times to apply erosion numDilate: how many times to apply dilation strelSize: structuring element dimension

The documentation for this class was generated from the following file:

- main.cpp

2.2 pixel Class Reference

A class to house the SG estimation for a single pixel.

```
#include <sgb.h>
```

Public Member Functions

- bool `init` (int num, double lr, double `thresh`)
Initialize the class with parameters passed on from the SGB class.
- void `normalize` ()
normalize the gaussian weights to unit length
- void `setPixelValue` (float px)
setPixelValue assign the pixel intensity
- bool `processValue` ()
processValue processes an incoming pixel value.
- void `initializeGaussian` (double *`mu`, double *`sigma`, double *`weight`)
initializeGaussian initializes a gaussian distribution.
- void `calculateWSigma` ()
calculateWSigma Calculate the weight/stddev metric for sorting gaussians.
- void `partitionGaussians` ()
partitionGaussians Specify which gaussians will form the background
- `~pixel` ()
Destructor.
- void `setMetaparameters` (double lr, double thr)
setMetaparameters Parameter setter
- double `gaussian` (int idx)
gaussian function evaluator
- void `updateGaussian` (int index)
updateGaussian Recompute gaussian parameters
- void `printGaussians` (string msg)
printGaussians Debugging print function.
- void `printGaussiansWS` ()
printGaussiansWS Debugging print function.

Public Attributes

- float `pixelValue`
The current pixel value.
- int `maxGaussians`
Max number of gaussians.
- int `numGaussians`
Current number of gaussians.
- vector< pair< double, int > > `wsigma`
Vector where to store the w/sigma quantities, per gaussian.
- double * `mu`
Array of gaussian means.
- double * `sigma`
Array of gaussian standard deviations.
- double * `weights`
Array of gaussian weights.
- double `learningRate`
The learning rate.
- double `thresh`
Threshold value.
- vector< int > `backgroundIdx`

- *Vector of indexes of the gaussians that form the background.*
- const float `initialSigma` = 10
Initial large standard deviation value for new gaussians.
- const bool `verbose` = false
For debug printing.
- bool `penalizeWeight`
Posterior addition to penalize the weight of new gaussians.

2.2.1 Detailed Description

A class to house the SG estimation for a single pixel.

This class contains the gaussian mixture model (means, standard deviations, number of gaussians) for a pixel.

2.2.2 Constructor & Destructor Documentation

2.2.2.1 `pixel::~~pixel () [inline]`

Destructor.

2.2.3 Member Function Documentation

2.2.3.1 `void pixel::calculateWSigma () [inline]`

`calculateWSigma` Calculate the weight/stdev metric for sorting gaussians.

This method uses `std::vector` and a lambda comparator to `std::sort` to sort the gaussians by the w/sigma metric.

2.2.3.2 `double pixel::gaussian (int idx) [inline]`

gaussian function evaluator

Parameters

<code>idx</code>	Which gaussian we want to compute.
------------------	------------------------------------

Returns

The computed value.

2.2.3.3 `bool pixel::init (int num, double lr, double thresh) [inline]`

Initialize the class with parameters passed on from the SGB class.

Parameters

<i>num</i>	number of gaussians
<i>lr</i>	learning rate
<i>thresh</i>	threshold

Returns

successfull initialization

2.2.3.4 `void pixel::initializeGaussian (double * mu, double * sigma, double * weight)` `[inline]`

initializeGaussian initializes a gaussian distribution.

Parameters

<i>mu</i>	pointer to the mu value of the gaussian
<i>sigma</i>	pointer to the stdev value of the gaussian
<i>weight</i>	pointer to the weight value of the gaussian

Mu is set to the current pixel value, sigma to a high, const value (default 10), and the weight to a low value of $1/\text{numGaussians}^2$.

2.2.3.5 `void pixel::partitionGaussians ()` `[inline]`

partitionGaussians Specify which gaussians will form the background

A running sum of the gaussian weights is computed. The gaussians are considered by decreasing w/sigma value. When the threshold value is reached, the partitioning ends, and included gaussians form the background.

2.2.3.6 `void pixel::printGaussians (string msg)` `[inline]`

printGaussians Debugging print function.

Parameters

<i>msg</i>	
------------	--

2.2.3.7 `bool pixel::processValue ()` `[inline]`

processValue processes an incoming pixel value.

Returns

true if it belongs in the background, else false.

The intensity is checked with the gaussian match criterion and the distributions update their parameters if they match the input or not, and update their weights as well. If a match does not occur, a new distribution is added to the collection. The wsigma computation and partitioning follows, and the function returns true if the pixel matched a background distribution.

2.2.3.8 `void pixel::setMetaparameters (double lr, double thr) [inline]`

setMetaparameters Parameter setter

Parameters

<i>lr</i>	learning rate
<i>thr</i>	threshold

2.2.3.9 `void pixel::setPixelValue (float px) [inline]`

setPixelValue assign the pixel intensity

Parameters

<i>px</i>	the pixel intensity value
-----------	---------------------------

2.2.3.10 `void pixel::updateGaussian (int index) [inline]`

updateGaussian Recompute gaussian parameters

Parameters

<i>index</i>	The index of the gaussian wwe want to modify.
--------------	---

This method uses the current pixel field value to alter the mean and stdev values.

The documentation for this class was generated from the following file:

- sgb.h

2.3 SGb Class Reference

The Stauffer-Grimson class.

```
#include <sgb.h>
```

Public Member Functions

- [SGB](#) (int [cols](#), int [rows](#))
SGB Constructor.
- [~SGB](#) ()
Destructor.
- bool [initialize](#) (vector< string > [opts](#), cv::Mat &[frame](#))
initialize Initialize the class,
- cv::Mat [process](#) (cv::Mat [inputFrame](#))
- void [info](#) ()
info Display current parameters.
- void [decreaseLR](#) ()
decreaseLR Decrease learning rate
- void [increaseLR](#) ()
increaseLR Increase learning rate
- void [increaseThreshold](#) ()
increaseThreshold Increase the threshold value
- void [decreaseThreshold](#) ()
decreaseThreshold Decrease the threshold value

Static Public Member Functions

- static void [usage](#) ()
usage Display method parameters
- static void [usage_controls](#) ()
usage_controls Display user interface information

Public Attributes

- [pixel](#) * [pixels](#)
Array of all pixels in the image.
- cv::Mat [outputFrame](#)
Output frame mat container.
- int [rows](#)
Image rows.
- int [cols](#)
Image columns.
- int [numGaussians](#)
Gaussians per pixel.
- double [learningRate](#)
The learning rate per pixel.
- double [threshold](#)
The threshold per pixel.

Static Public Attributes

- static const string [name](#) ="SG"
Method name.

2.3.1 Detailed Description

The Stauffer-Grimson class.

2.3.2 Constructor & Destructor Documentation

2.3.2.1 `SGb::SGb (int cols, int rows)` `[inline]`

[SGb](#) Constructor.

Parameters

<i>cols</i>	Image columns
<i>rows</i>	Image rows

2.3.2.2 `SGb::~~SGb ()` `[inline]`

Destructor.

2.3.3 Member Function Documentation

2.3.3.1 `bool SGb::initialize (vector< string > opts, cv::Mat & frame)` `[inline]`

initialize Initialize the class,

Parameters

<i>opts</i>	Options string vector
<i>frame</i>	Initial frame

Returns

Successful initialization
